# Standardized Scores & Probability

If we know the mean and standard deviation of any population, then we can standardize the score of the  $i$ th case in the population:

$$Z_i = \frac{Y_i - \mu_Y}{\sigma_Y}$$

If the population has a normal distribution, we can use the known relation between  $Z$  scores and areas under the standardized normal curve to find probabilities of different segments.

Use the standardized  $Z$ -score table  
(Appendix C) to look up the area(s):

**(a) from the mean ( $Z=0$ ) to  $\pm Z_i$**

**(b) from  $Z_i$  to  $\pm \infty$**

# Convert $Y_i$ to $Z_i$ in a Population

In a population where  $\mu_Y = 15$  and  $\sigma_Y^2 = 4$ , change these  $Y_i$  scores to  $Z_i$  :

$Y_i$

$Z_i$

# Sampling distribution mean & std. error

Even if a population is not normally distributed, the Central Limit Theorem assures that, for large  $N$  samples, the **sampling distribution of sample means** will approximate a normal distribution, whose mean and standard error have these relations to the population mean and standard deviation:

$$\mu_{\bar{Y}} = \mu_Y \qquad \sigma_{\bar{Y}} = \frac{\sigma_Y}{\sqrt{N}}$$

For a population with  $\mu_Y = 38$  and  $\sigma_Y = 3$ , what are the sampling distribution means and standard errors for samples of these size  $N$ s?

<b>N</b>	$\mu_{\bar{Y}}$	$\sigma_{\bar{Y}}$
<b>400</b>	_____	_____
<b>800</b>	_____	_____

# Confidence Intervals

Another application of the Central Limit Theorem is to construct a **confidence interval**, a range of scores around a sample point estimate. If we either know or can estimate the standard error of a sampling distribution, then we can construct 95% and/or 99% confidence intervals around the point estimate of any sample statistic (such as a sample mean or proportion). For all the samples of size = N, the population parameter will fall inside the CI – the range of values between **lower and upper confidence limits** – 95% or 99% of the time, respectively.

$$\bar{Y} \pm (Z_{\alpha/2})(\sigma_{\bar{Y}})$$

**Upper confidence limit, UCL:**

$$\bar{Y} + (Z_{\alpha/2})(\sigma_{\bar{Y}})$$

**Lower confidence limit, LCL:**

$$\bar{Y} - (Z_{\alpha/2})(\sigma_{\bar{Y}})$$

# Compute & Interpret CIs

A recent poll of 553 consumers finds that their mean optimism about the economy is  $\bar{Y} = 68$ . If the estimated standard error is  $\sigma_{\bar{Y}} = 4$ , what are the lower & upper limits of the 95% and 99% CIs?

$$\bar{Y} \pm (Z_{\alpha/2})(\sigma_{\bar{Y}}) = 68 \pm (1.96)(4)$$

$$\text{LCL} = \underline{\hspace{2cm}}$$

$$\text{UCL} = \underline{\hspace{2cm}}$$

$$\bar{Y} \pm (Z_{\alpha/2})(\sigma_{\bar{Y}}) = 68 \pm (2.58)(4)$$

$$\text{LCL} = \underline{\hspace{2cm}}$$

$$\text{UCL} = \underline{\hspace{2cm}}$$

**INTERPRETATIONS:** We can be 95% confident that the mean consumer optimism in the population is inside the interval from 60.2 to 75.8. We can be 99% confident that the population's mean consumer optimism falls into the range from 57.7 to 78.3.

# Steps in Testing Hypotheses

1. Write the research hypothesis ( $H_1$ ) & null hypothesis ( $H_0$ ) in English
2. Restate the hypothesis pair in symbolic form. For two-tailed tests, rearrange to show the expected difference in parameter values:

$$H_0: \mu_1 = \mu_2$$

$$H_1: \mu_1 \neq \mu_2$$

$$H_0: \mu_1 - \mu_2 = 0$$

$$H_1: \mu_1 - \mu_2 \neq 0$$

3. Chose an  $\alpha$ -level for  $H_0$  (i.e., set the probability of Type I, or false rejection, error). Alternatively, after calculating the t-test (#5), determine the smallest  $\alpha$ -level at which you can reject  $H_0$
4. In the normal ( $Z$ ) table, find critical value(s) (c.v.) of  $t$  for the  $\alpha$ -level
5. Calculate the  $t$ -test statistic, using the sample size(s) and standard deviation(s) to estimate the sampling distribution's standard error
6. Compare this  $t$ -test statistic to the c.v. to see if it falls into or outside the region(s) of rejection & decide whether to reject  $H_0$  in favor of  $H_1$
7. If you decide to reject the null hypothesis,  $H_0$ , then state the probability that you made a Type I, or false rejection, error ( $p = \alpha$ )

# Useful Formulas

Estimate the standard error using two sample values.

For a single sample:

$$\hat{\sigma}_{\bar{Y}} = \sqrt{s^2 / N} = s / \sqrt{N}$$

For two samples:

$$\hat{\sigma}_{(\bar{Y}_1 - \bar{Y}_2)} = \sqrt{s_1^2 / N_1 + s_2^2 / N_2}$$

Use this estimated standard error to compute the *t*-test.

For a single sample:

$$t = \frac{\bar{Y} - \mu}{s / \sqrt{N}}$$

For two samples:

$$t = \frac{(\bar{Y}_1 - \bar{Y}_2) - (\mu_1 - \mu_2)}{\sqrt{s_1^2 / N_1 + s_2^2 / N_2}}$$

Here are the critical values of *t* for the three conventional regions of rejection:

$\alpha$ (alpha)	One-tail c.v. for <i>t</i>	Two-tail c.v. for <i>t</i>
<b>.05</b>	<b>1.65</b>	<b>±1.96</b>
<b>.01</b>	<b>2.33</b>	<b>±2.58</b>
<b>.001</b>	<b>3.07</b>	<b>±3.29</b>

# Write Hypotheses Pairs

To encourage you to invest in the stock market, your broker predicts that the Dow-Jones Industrial Average will rise past 12,000 sometime before the end of this year. Write her research and null hypothesis in both English language and symbolic form:

**H<sub>0</sub>:** \_\_\_\_\_

**H<sub>1</sub>:** \_\_\_\_\_

**H<sub>0</sub>:** \_\_\_\_\_

**H<sub>1</sub>:** \_\_\_\_\_

Is this a one-tail or two-tailed test? \_\_\_\_\_

Why? \_\_\_\_\_

\_\_\_\_\_

# Test a Null Hypothesis about One Mean

An economist believes that the average tax rebate was more than \$300.

**Sample statistics: Mean = \$325; s.d. = \$200; N = 400**

Write the hypothesis pair:

**H<sub>0</sub>:** \_\_\_\_\_

**H<sub>1</sub>:** \_\_\_\_\_

Set  $\alpha = .001$  and find c.v. for  $t$ -test: \_\_\_\_\_

Estimate standard error and the  $t$ -test:

$$t = \frac{\bar{Y} - \mu_Y}{s_Y / \sqrt{N}} = \underline{\hspace{10em}}$$

Compare  $t$ -score to c.v., decide H<sub>0</sub>: \_\_\_\_\_

What is probability of Type I error? \_\_\_\_\_

Conclusion: \_\_\_\_\_

# Test Another One

The mean patient stay in hospital this year differs from last year's 4.5 days.

**Sample statistics: Mean = 4.7; s.d. = 1.7; N = 874**

Write the hypothesis pair:

**H<sub>0</sub>:** \_\_\_\_\_

**H<sub>1</sub>:** \_\_\_\_\_

Set  $\alpha = .05$  and find c.v. for  $t$ -test:

\_\_\_\_\_

Estimate standard error and the  $t$ -test:

$$t = \frac{\bar{Y} - \mu_Y}{s_Y / \sqrt{N}} = \underline{\hspace{10em}}$$

Compare  $t$ -score to c.v., decide H<sub>0</sub>: \_\_\_\_\_

What is probability of Type I error? \_\_\_\_\_

Conclusion: \_\_\_\_\_

# Test a Null Hypothesis about a Proportion

More than 80% of UM students graduate within six years.

**Sample statistics:  $p = 0.85$ ;  $N = 200$**

Write the hypothesis pair:

**$H_0$ :** \_\_\_\_\_

**$H_1$ :** \_\_\_\_\_

Set  $\alpha = .01$  and find c.v. for  $t$ -test:

\_\_\_\_\_

Estimate standard error and the  $t$ -test:

$$t = \frac{p - \rho}{\sqrt{pq / N}} = \underline{\hspace{10cm}}$$

Compare  $t$ -score to c.v., decide  $H_0$ : \_\_\_\_\_

What is probability of Type I error? \_\_\_\_\_

Conclusion: \_\_\_\_\_

# Test a Mean Difference Hypothesis

Students studying for the exam score higher than those who don't.

**H<sub>0</sub>:** \_\_\_\_\_

**H<sub>1</sub>:** \_\_\_\_\_

$$t = \frac{(\bar{Y}_1 - \bar{Y}_2) - (\mu_1 - \mu_2)}{\sqrt{s_1^2 / N_1 + s_2^2 / N_2}}$$

= \_\_\_\_\_
